BIOTECHNOLOGY AND FISHERY DR PRASHANT V PATIL

2020-2021

Biotechnology in fisheries represents a range of technologies that present apportunities to increase growth rate in framed species to improve nutrition of aquafeeds to help restore and protect environments, to extend the range of aquatic species and to improve management and conservation of wild stocks. The main emphasis of early studies was placed on defining the meroblastic pattern of releastean development and piscine features of embryogenesis and organ and its site formation. Some attention was given to the diverse embryonic adaptations for wiviparity in different taxa. Genetically modified fish pose economic benefits to unknown, further nessent, review, and monitoring is important. Conducting thorough studies under near natural environmental conditions provides our one hope of assessing the risks associated with the introduction of genetically modified fish biotechnology. It makes an incisive and deep examination of the process principles and practices that centre biotechnology in aquaculture and fisher with particular emphasis on current issues and problems in the field.
